1. Role of Query Editor in Power BI

Query Editor is used to clean, prepare, and transform data before using it in Power BI reports.

It helps to:

- Remove unnecessary rows and columns.
- Change data types such as text, number, and date.
- Rename columns and tables.
- Remove duplicate or blank values.
- Split or merge columns.
- Filter and sort data.
- Combine data from different sources.
- Create new columns using transformations.
-

2. Data Transformation in Power BI

Data transformation means changing and cleaning raw data into a suitable format for analysis using Power Query.

Data transformation is critical because it:

- Improves data accuracy.
- Removes errors and duplicates.
- Makes data consistent.
- Ensures calculations and visualizations are correct.
- Makes the dataset easier to analyze.
- Helps produce reliable reports and dashboards.
